1. Introduction

RooMate is a web app for people trying to find a place to live in Mumbai, Bengaluru, and other crowded cities. The pitch is simple: finding a room is usually the easy part. Finding someone you can actually live with is not. Most property platforms show you photos and a price and call it done. RooMate tries to solve the other half of the problem.

2. The Problem (Problem Statement)

You can find a flat in a week and spend the next year resenting your flatmate for it. Noise, mess, splitting bills, different sleep schedules — these conflicts are predictable, but most platforms do nothing to help you avoid them. They match people to rooms, not to each other.

RooMate uses a 7-question lifestyle quiz to surface things that actually cause friction: sleep habits, cleanliness standards, guests, work-from-home, that sort of thing. Listings are verified. Browsing uses a swipe interface. Each potential match comes with a Compatibility Score so you're not going in blind.

3. Design

RooMate has four main parts. The listings screen lets you filter by city, rent, and practical tags — "WFH Friendly," "Pet Friendly," and similar. The swipe screen works on the same basic logic as a dating app: you go through potential roommates one card at a time. The quiz is 7 questions about daily habits — sleep times, how often you have guests, noise tolerance — and spits out a match percentage at the end. The dashboard is where you manage your profile, see your Safety Score, and split utility bills with whoever you're living with.

4. Technology

The front-end is HTML5 and CSS3, laid out to work on both mobile and desktop without a separate mobile version. JavaScript runs the filters, the swipe gestures, and the bill calculations. Matching works on a weighted score — each quiz answer carries a different weight depending on how much that habit tends to cause conflict, and the scores are totalled into a single percentage. Animations handle screen transitions, and there's a spider-chart-style visual called the "3D Compatibility Blueprint" that shows at a glance where two people's habits line up and where they don't.

5. Implementation Details

The project is split into pages that each handle one part of the flow:

- **listings.html / listings.js** — the property side. Shows verified room listings and breaks down total rent into per-person costs so users aren't doing mental math.
- **people.html / people.js** — the roommate side. Handles discovery and includes a basic simulated chat so users can get a feel for a match before committing to a real conversation.
- **quiz.html** — a step-by-step lifestyle form with a progress indicator. Keeps the experience from feeling like a wall of questions.

6. Results and Conclusion

A few things stood out during testing. Filtering by lifestyle traits — things like preferred quiet hours or cleanliness habits — helped users discard bad matches faster than location or price alone. The Safety Index and Utility Splitter also did more work than expected; users responded well to having financial and safety information upfront, before any viewing or meetup.

The mobile-first decision held up. Most users searched on their phones, and the layout needed to work there first.

The platform isn't perfect — the chat feature is simulated, and compatibility scores are only as good as the quiz answers users provide. But the core idea works: treating a flatmate search more like finding a collaborator than scanning a notice board leads to better outcomes for both sides.
